Why Nuclear Power? It's a question worth asking. And ask it we do. Every year the United States gathers in subcommittees and workshops and gets together in consultations and roundtables and makes sure the nuclear industry is in line with the administration and Congress and public opinion and the rest of the world. We keep an eye on China and Russia and India and other nations that are building their own plants. And we take a keen interest in technical innovations and improvements. We do all this because we've been preparing to retire nuclear power in this country for a long time now. We do all this because we've been preparing to retire nuclear power in this country for a long time now. A number of trends in recent years have put the United States in a bad position. First, the high cost of fission has forced power companies to rely increasingly on coal as an inexpensive source of electricity. Thus coal-fired generation has become the leading source of electricity production in this country. Next, widespread, often out-of-date technology has been the norm at the nuclear industry's plants. It has been decades since the Westinghouse design reactors were generally considered state-of-the-art. Increasingly, too, the economic incentives created by regulatory regimes throughout the country have been less than optimal for private power companies and the public they serve. The Department of Energy has a bunch of programs to keep nuclear plants running, when they have no real business remaining in their current states. The economic burdens imposed on utilities by a federal government extension of renewable and mandated energy sources have been particularly egregious. This winter, in the wake of the 2010 volcanic eruption in Iceland and the subsequent nuclear incident at Fukushima, the issue of public safety has emerged as an important factor. In these and many other ways, the United States is not positioned well for the next decade. Whether or not that makes nuclear power — an energy source that poses a few hazards but no risk for human life — the last choice for our energy future is an unanswerable question. But there are reasonable ways to do a cost-benefit analysis. One way is to look at what the future might hold with nuclear power and without. The numbers are not hard to find. Right now, all the world's nuclear reactors are in countries other than the United States. (The U.S. is the

expression in pre-donor-derived samples when compared to their B-cell counterparts. Preliminary data on the degree of inflammatory related gene expression in pre-donors' samples show that these transcriptional profiles are similar to those of p-OPCDM+ donors (data not shown). It would be interesting to investigate the transcription of inflammation-related genes that could explain the lack of cellular infiltration in pre-donors' samples. The current analysis provides a complete description of paired circulating B and NK cell subsets in p-OPCDM+, p-OPCDM- and c-OPCDM+ donors with respect to their phenotype, function and transcriptional profiles. It provides information that could allow for a better characterization of allo-immune responses between these three donor groups. Our study has some limitations. First, a sample size of 34 was relatively small for the multivariate analyses performed. However, the linear regression models and GSEA analysis provide complementary information about the impact of OP transplantation on PB NK cell subsets and inflammatory genes, even if these analyses are influenced by the small sample size. Second, our analyses were based on the analysis of only the cells recovered from the cryopreserved PB samples. It would be interesting to perform the same analyses using PB samples that are freshly isolated from the donors' blood. However, it is very unlikely that all the properties of PB NK cells are conserved at the single cell level. Therefore, it is more appropriate to investigate the more stable properties of the circulating NK cell subsets. Third, our analysis was performed using SPME-based method for the analyses of inflammatory genes. The results obtained in this study on the role of different donor types in PB NK cell subsets can be partially biased by the SPME method used for the gene expression analysis. However, the impact of this bias is likely limited since the expression profiles of PB NK cells were similar among donors. Therefore, it is more likely that donor type and stage of donation (p-OPCDM, c-OPCDM and p-OPCDM+) account for all of the variation in PB NK cells. Finally, the transcriptional profiles of PB NK cells could be altered by the transplantation-induced changes in signaling pathways. This may lead to the modification of the transcriptional profile of PB NK cells during the transplant-related stress episodes. However, previous studies have demonstrated that following transplantation with PB NK cells the transcriptional profile of these cells is conserved [1].
